(54) Title: NOVEL SUBSTITUTED 3-SULFUR INDOLES

(57) Abstract: The present invention relates to substituted indoles useful as pharmaceutical compounds for treating respiratory disorders.

WO 2004/106302 A1

## NOVEL COMPOUNDS

The present invention relates to substituted indoles useful as pharmaceutical compounds for treating respiratory disorders, pharmaceutical compositions containing them, and processes for their preparation.

EPA 1 170 594 discloses methods for the identification of compounds useful for the treatment of disease states mediated by prostaglandin D2, a ligand for orphan receptor CRTh2. US 5,486,525 discloses a series of indoles said to possess PAF antagonist activity. It has now surprisingly been found that certain indole acetic acids are active at the CRTh2 receptor, and as a consequence are expected to be potentially useful for the treatment of various respiratory diseases, including asthma and COPD.

In a first aspect the invention therefore provides a compound of formula (I) or a pharmaceutically acceptable salt and solvates thereof:

and pharmaceutically acceptable salts and solvates thereof.

Certain compounds of formula (I) are capable of existing in stereoisomeric forms. It will  
15 be understood that the invention encompasses all geometric and optical isomers of the compounds of formula (I) and mixtures thereof including racemates. Tautomers and mixtures thereof also form an aspect of the present invention.

The compound of formula (I) above may be converted to a pharmaceutically acceptable  
20 salt or solvate thereof, preferably a basic addition salt such as ammonium, sodium, potassium, calcium, aluminium, lithium, magnesium, zinc, benzathine, chlorprocaine, choline, diethanolamine, ethanolamine, ethyldiamine, meglumine, tromethamine or procaine, or an acid addition salt such as a hydrochloride, hydrobromide, phosphate, acetate, fumarate, maleate, tartrate, citrate, oxalate, methanesulphonate or *p*-  
25 toluenesulphonate. Preferred salts include sodium and ammonium salts.

It will be appreciated by those skilled in the art that in the processes of the present invention certain functional groups in the starting reagents or intermediate compound may need to be protected by protecting groups. Thus, the preparation of the compound of  
30 formula (I) may involve, at an appropriate stage, the removal of one or more protecting groups. The protection and deprotection of functional groups is fully described in 'Protective Groups in Organic Chemistry', edited by J. W. F. McOmie, Plenum Press

(1973), and 'Protective Groups in Organic Synthesis', 3rd edition, T. W. Greene & P. G. M. Wuts, Wiley-Interscience (1999).

In a further aspect the invention provides a process for the preparation of a compound of formula (I) or a pharmaceutically acceptable salt or solvate thereof which comprises reaction of a compound of formula (II):

(II)

in which R<sup>1</sup>, R<sup>2</sup> and R<sup>3</sup> are as defined in formula (I) or are protected derivatives thereof, with a compound of formula (IIA):

where R<sup>17</sup> is an alkyl group and L is a leaving group such as a halogen atom, in the presence of a base, and optionally thereafter in any order:

- removing any protecting group
- hydrolysing the ester group R<sup>17</sup> to the corresponding acid
- forming a pharmaceutically acceptable salt or solvate.

The reaction can be carried out in a suitable solvent such as THF using a base such as sodium hydride or the like. Suitable groups R<sup>17</sup> include C<sub>1-6</sub> alkyl groups such as methyl, ethyl or *tertiary*-butyl. Suitable L is a leaving group such as halo, in particular bromo. Preferably the compound of formula (IIA) is ethyl, methyl or *tertiary*-butyl bromoacetate.

Hydrolysis of the ester group R<sup>17</sup> can be carried out using routine procedures, for example by stirring with aqueous sodium hydroxide or trifluoroacetic acid.

It will be appreciated that certain functional groups may need to be protected using standard protecting groups. The protection and deprotection of functional groups is for example, described in 'Protective Groups in Organic Chemistry', edited by J. W. F.

- 5 McOmie, Plenum Press (1973), and 'Protective Groups in Organic Synthesis', 3rd edition, T. W. Greene & P. G. M. Wuts, Wiley-Interscience (1999).

10 chloride.

- 15 Compounds of formula (III) can be prepared from compounds of formula (IV) by reduction using a hydrogen and a suitable catalyst, preferably, the catalyst used is palladium or platinum on activated carbon in the presence of a polar solvent such as ethanol.

Compounds of formula (IV) can be prepared from compounds of formula (V) and (VI)

in which  $R^1$ ,  $R^2$  and  $R^3$  are as defined in formula (I).

5

Preferably the reaction is carried out in a suitable solvent, such as dichloromethane or THF, using a chlorinating agent such as sulfonyl chloride or *tert*-butyl hypochlorite.<sup>1</sup>

Compounds of formulae (V) and (VI) are commercially available or can be prepared using  
10 standard chemistry well known in the art.

Certain compounds of formula (I) can be prepared from compounds of formula (VII) where X = halogen, preferably bromine or iodine, by reaction with organostannanes (Stille couplings) or boronic acids (Suzuki couplings) using palladium catalysis. Preferably the catalysts used are tetrakis palladium triphenylphosphine(0), or palladium(II)acetate in the presence of a phosphine ligand such as tri-*ortho* tolyl phosphine, in a suitable solvent such as toluene or methanol at 80°C. The group R<sup>17</sup> is subsequently hydrolysed as outlined previously.

Compounds of formula (VII) are prepared from compounds of formula (II) with compounds of formula (IIA) as outlined previously:

25

10

Compounds of formula (II), where X is halogen are prepared by reacting a compound of  
 5 formula (VIII) with a compound of formula (VI):

10

in which R<sup>1</sup>, R<sup>2</sup> and R<sup>3</sup> are as defined in formula (I).

Compounds of formula (II) can be prepared by reacting a compound of formula (IX) with a  
 15 compound of formula (X), with subsequent hydrolysis of the ester as outlined previously  
 for the synthesis of compounds of formula (I):

20 in which R<sup>1</sup>, R<sup>2</sup> and R<sup>3</sup> or protected derivatives thereof, are as defined in formula (I). The  
 reaction is carried out in a suitable solvent in the presence of a halogen, preferably iodine  
 at room temperature, in a polar aprotic solvent, for example DMF. Compounds of formula

(IX) and (X) are commercially available or can be prepared by methods well known in the art.

## Pharmacological Data

### Ligand Binding Assay

- 5    [<sup>3</sup>H]PGD<sub>2</sub> was purchased from Perkin Elmer Life Sciences with a specific activity of 100-210Ci/mmol. All other chemicals were of analytical grade.

HEK cells expressing rhCRTh2 / Gα16 were routinely maintained in DMEM containing 10% Foetal Bovine Serum (HyClone), 1mg/ml geneticin, 2mM L-glutamine and 1% non-essential amino acids. For the preparation of membranes, the adherent transfected HEK cells were grown to confluence in two layer tissue culture factories (Fisher, catalogue number TKT-170-070E). Maximal levels of receptor expression were induced by addition of 500mM sodium butyrate for the last 18 hours of culture. The adherent cells were washed once with phosphate buffered saline (PBS, 50ml per cell factory) and detached by the addition of 50ml per cell factory of ice-cold membrane homogenisation buffer [20mM HEPES (pH 7.4), 0.1mM dithiothreitol, 1mM EDTA, 0.1mM phenyl methyl sulphonyl fluoride and 100µg/ml bacitracin]. Cells were pelleted by centrifugation at 220xg for 10 minutes at 4°C, re-suspended in half the original volume of fresh membrane homogenisation buffer and disrupted using a Polytron homogeniser for 2 x 20 second bursts keeping the tube in ice at all times. Unbroken cells were removed by centrifugation at 220xg for 10 minutes at 4°C and the membrane fraction pelleted by centrifugation at 90000xg for 30 minutes at 4°C. The final pellet was re-suspended in 4ml of membrane homogenisation buffer per cell factory used and the protein content determined. Membranes were stored at -80°C in suitable aliquots.

25

All assays were performed in Corning clear bottomed, white 96-well NBS plates (Fisher). Prior to assay, the HEK cells membranes containing CRTh2 were coated onto SPA PVT WGA beads (Amersham). For coating membranes were incubated with beads at typically 25µg membrane protein per mg beads at 4°C with constant agitation overnight. (The optimum coating concentrations were determined for each batch of membranes) The beads were pelleted by centrifugation (800xg for 7minutes at 4°C), washed once with assay

30

buffer (50mM HEPES pH 7.4 containing 5mM magnesium chloride) and finally re-suspended in assay buffer at a bead concentration of 10mg/ml.

Each assay contained 20 $\mu$ l of 6.25nM [ $^3$ H]PGD<sub>2</sub>, 20 $\mu$ l membrane saturated SPA beads  
5 both in assay buffer and 10 $\mu$ l of compound solution or 13,14-dihydro-15-keto  
prostaglandin D<sub>2</sub> (DK-PGD<sub>2</sub>, for determination of non-specific binding, Cayman chemical  
company). Compounds and DK-PGD<sub>2</sub> were dissolved in DMSO and diluted in the same  
solvent to 100x the required final concentration. Assay buffer was added to give a final  
concentration of 10% DMSO (compounds were now at 10x the required final  
10 concentration) and this was the solution added to the assay plate. The assay plate was  
incubated at room temperature for 2 hours and counted on a Wallac Microbeta liquid  
scintillation counter (1 minute per well).

Compounds of formula (I) have an IC<sub>50</sub> value of less than (<) 10 $\mu$ M.

15 Specifically, example 14 has a pIC<sub>50</sub> = 6.65, example 26 has a pIC<sub>50</sub> = 8.35, and example  
34 has a pIC<sub>50</sub> = 9.4.

# INTERNATIONAL SEARCH REPORT

International application No.  
PCT/SE2004/000808

## Box No. II Observations where certain claims were found unsearchable (Continuation of item 2 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.: 7-8  
because they relate to subject matter not required to be searched by this Authority, namely:  
**see next sheet**
2. ☐ Claims Nos.:  
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

## Box No. III Observations where unity of invention is lacking (Continuation of item 3 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

### Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.  
☐ No protest accompanied the payment of additional search fees.
